PREFACE TO THE THIRD EDITION

Although this book is designed primarily for chemists and chemical engineers it contains a large number of terms from related fields of science and hence **has** proved useful also to physicists, biologists, geologists, etc. It was the first technical dictionary, as far as the author knows, to include a vocabulary of *general* words (see the Introduction). Special attention has been paid to prefixes, suffixes, and abbreviations. All the parts of speech are indicated by the customary marks. Labels are freely used to indicate the field in which a German word has a particular English meaning. Many obsolete or antiquated chemical terms are defined as a help to reading the older literature; where they might be confused with modern meanings they are distinguished by the label "*Old Chem.*" or in some other way. (It should be remembered that some terms that have been replaced in chemistry are still in use in pharmacy or industry.) Words that have the same, or practically the same, spelling in German and English have in general been omitted in order to economize space.

The Introduction furnishes hints for using the book and devotes special attention to the peculiarities of German chemical nomenclature.

The vocabulary in this edition contains an estimated total of 59,000 terms, some of the larger additions being in the fields of chemical technology, electronics, and warfare. Additional meanings are given for many terms that were listed in the earlier editions. The latest decisions in nomenclature are followed; in particular, the Stock valence names for inorganic compounds are freely given, as well as the older names.

The German-English vocabularies chiefly consulted are as follows: *General*: Duden, *Orthographisches Wörterbuch*; Flügel-Schmidt-Tanger, *Deutsch-Englisches Wörterbuch*; Hebert-Hirsch, *New German-English Dictionary*; Muret-Sanders, *Encyclopädisches Deutsch-Englisches Wörterbuch*. *Technical*: Allied Control Commission for Germany, *Glossary of Technical Terms of the Oil Industry*; Artschwager, *Dictionary of Biological Equivalents*; Bading, *Wörterbuch der Landwirtschaft*; Cissarz-Jones, *German-English Geological Terminology*; De Vries, *German-English Science Dictionary*; Eger, *Technologisches Wörterbuch*; Freeman, *Das Englische Fachwort*; Freeman, *Deutsch-Englisches Spezial-Wörterbuch für das Maschinenwesen*; Freeman, *Elektrotechnisches Englisch*; Freeman, *Fachwörterbuch der Metallurgie*; Harras, *Technologisches Wörterbuch*; Hinnerichs, *Deutsch-Englisches Fachwörterbuch*; Hoyer-Kreuter-Schlomann, *Technologisches Wörterbuch* (6th edition); I. G. Farbenindustrie,

Fachwörterbuch für die Farbstoffe und Textilhilfsmittel verbrauchenden Industrien; King-Fromherz, *German-English Chemical Terminology*; König-Bohrisch, *Warenlexikon für den Verkehr mit Drogen und Chemikalien*; Lang-Meyers, *German-English Medical Dictionary*; Lingen, *Deutsch-Englisch Fachwörterbuch Papier und Druck*; Mayer, *Chemisches Fachwörterbuch*; Partridge, *Dictionary of Bacteriological Equivalents*; Pietzsch, *Fremdsprachliches Optisches Wörterbuch*; Regen-Regen, *German-English Dictionary for Electronics Engineers and Physicists*; Ruis, *Bergbau Fachwörterbuch*; v. Seebach, *Fachwörterbuch für Bergbautechnik und Bergbauwirtschaft*; Singer, *German-English Dictionary of Metallurgy*; Slater, *Pitman's Technical Dictionary of Engineering and Industrial Science*; U. S. Air Force *German-English Technical Dictionary* (ed. Leidecker); Webel, *German-English Technical and Scientific Dictionary*; Wittfoht, *Kunststofftechnisches Wörterbuch*; and various glossaries. Textbooks, journals, and dealers' catalogs have also been examined for words.

The author is grateful to the many friends and correspondents who have co-operated in improving the dictionary. He is specially indebted to Prof. William T. Hall, Prof. C. W. Foulk, Prof. Paul Rothemund and Miss Janet D. Scott for assistance in proofreading and for suggestions; to Dr. E. J. Crane and the *Chemical Abstracts* corps for general help; to Prof. H. V. Knorr for coöperation on terms in atomic structure; and to Mr. T. E. R. Singer for aid in procuring German books after World War II. Others who deserve special mention are: Dr. Nicolas W. Baklanoff, Dr. D. D. Berolzheimer, Dr. C. C. Davis, Dr. Francis C. Frary, Miss Mildred W. Graffin and associates, Dr. Geo. C. O. Haas, and Prof. Kurt F. Leidecker.

As in the past, corrections and suggestions for additions are welcomed.

INTRODUCTION

To the advanced worker in chemistry a knowledge of German is almost indispensable, since a very large proportion of chemical literature is published in that language. Even if he has had a good general course in German (which is too often not the case), he must become familiar with an immense special vocabulary which no dictionary can give completely. It is hoped, therefore, that the following hints as to the use of this dictionary will be found helpful.

General Words. A general vocabulary which is superior to many pocket dictionaries has been included, for two reasons: first, to save the user the trouble of looking up the more common German words in a separate dictionary; and secondly, because many general words have one or more technical meanings. In a general work these meanings are often either absent or buried among other senses. In this dictionary the special chemical meaning is put first or indicated in some way, the aim being in all cases to give the user immediately the meaning he is most likely to be seeking.

Self-evident Words. Words which are common to English and German (even with a slight variation in spelling), and which are therefore so readily recognized that they are not likely to be looked up, are omitted from the vocabulary, unless there is a special reason for inserting them.

Spelling. Owing to official German spelling reforms, many variant spellings appear in the current literature. In this book both old and new forms are freely given, or what seems to be the prevailing chemical usage is followed, though in doubtful cases the official form is preferred. Those who wish to know the correct official spellings should consult Duden's "Orthographisches Wörterbuch" (inexpensive) or some similar book. For ordinary purposes it will suffice to know the following changes, which are not all invariable, but which apply to many words:

c (hard) becomes **k**, as in Kohäsion.

c (with sound of ts) becomes **z**, as in Zylinder.

ff and similar triplets lose one member, as Schiffahrt for Schiffahrt.

i becomes **ie** in the verb ending -ieren (formerly -iren).

ph becomes **f**, as in Efeu (formerly Epheu).

th becomes **t**, as in Ton (formerly Thon).

ti becomes **zi** in certain cases, as in Reagenzien.

Umlauts are represented by two dots (never by e), as *Ä* instead of Ae. In this dictionary the only effect of an umlaut on the vocabulary order is to make the word follow a word of the same spelling without the umlaut. Thus *fallen* immediately follows *faellen* and is not placed under *fae-*. Similarly *Äther* is found under *At-*, not under *Aet-*.

In the vocabulary *s* is used to represent both *ſ* and *ß*, and *ss* for *ſſ* (and sometimes for *SZ* when the word is spelled in capitals; thus *STRASZE* would be found as *Strasse*).

Noun Endings. Since the case endings of nouns are occasionally puzzling, a résumé of the ways in which German nouns may form nominative plurals from nominative singulars may be of assistance (note specially 7):

1. No change, as *Kasten* from *Kasten*.
2. Umlaut, as *Vögel* from *Vogel*.
3. Ending *-e*, as *Jahre* from *Jahr*.
4. Umlaut and *-e*, *Bäume* from *Baum*.
5. Ending *-er* and umlaut if possible, *Männer* from *Mann*, *Kinder* from *Kind*.

6. Ending *-n*, *-en*, or *-nen*, *Blumen* from *Blume*, *Doktoren* from *Doktor*, *Wirtinnen* from *Wirtin*.

7. Plurals from Latin and Greek neuters: *Studien* from *Studium*, *Materialien* from *Material*, *Dramen* from *Drama*.

The other cases are either the same as the corresponding nominative or formed from it, as follows: genitive singular, *-en*, *-ens*, *-es*, *-n*, *-ns*, or *-s*; dative and accusative singular and dative plural, *-n* or *-en*.

Irregular Verbs. The preterit, past participle, and present third singular (indicative) of *simple* verbs are given in all cases where the student might miss finding the meaning. In the case of compound verbs, if the irregular parts are not given one can easily find them by going back to the simple form; thus, if *verschob* is not found, *schob* is looked for and found to be the preterit of *schieben*, whence *verschob* is the preterit of *verschieben*. Again, if *zerrissen* were not found, the form *gerissen* would be looked up, because it is the corresponding part of the simple verb; it is the past participle of *reißen*, and accordingly *zerrissen* is from *zerreißen*. Regularly formed "strong" past participles like *gebacken* are not systematically entered because they merely prefix *ge-* to the infinitive. Participles used as adjectives are "run in" after the verbs from which they are derived. For the inflection of verbs, adjectives, etc., a grammar must be consulted.

Adverbs. Since in German nearly any adjective may be used adverbially without change of form, the user of the dictionary is ordinarily left to form these adverbial meanings for himself.

Prefixes and Suffixes. Combining forms are given plentifully in the vocabu-

ary in the hope that the reader may often be able to determine the meaning of words that are not found in the dictionary. He is earnestly urged to make use of them, especially the suffixes, which are likely to be overlooked. Some of those defined are: -ähnlich, -artig, -bar, -de, -el, -en, -er, -erlei, -ern, -fach, -falt, -fältig, -förmig, -haft, -haltig, -heit, -icht, -ieren, -ig, -in, -isch, -keit, -lich, -ling, -los, -mässig, -nis, -ös, -sam, -schaft, -ung, -ür, -wärts, -weise.

Abbreviations. Many abbreviations found in German chemical literature but not in English are entered in the vocabulary in their proper places, as if the letters composing them spelled a word. An abbreviation is often converted from singular to plural by doubling the final letter; as, *Lsg.*, Lösung; *Lsgg.*, Lösungen.

Inorganic Nomenclature. Compounds may be named in German merely by compounding the names of the elements; as, *Jodkalium* (potassium iodide), *Siliziumfluorwasserstoff* (hydrogen silicofluoride, fluosilicic acid). Words formed from the names of two elements are usually to be translated by giving the *-ide* ending to the first part (*Jodkalium*, potassium iodide).

Compounds are also named in a manner more like the English method; as, *Strontiumchlorid* (strontium chloride), *Kaliumsulfid* (potassium sulfide). To indicate a lower compound the ending *-ür* is used where *-ous* or *sub-* would occur in English; as, *Kupferchlorür* (cuprous chloride), *Silberchlorür* (silver subchloride). In corresponding names *-id* and *-ür* are contrasted like *-ic* and *-ous* in English; thus, *Kupferchlorid*, in addition to its general sense of "copper chloride," is used particularly to designate cupric chloride. Another way of distinguishing between two compounds of the same elements is by the use of Latin combining forms; as, *Cuprochlorid*, cuprous chloride; *Cuprichlorid*, cupric chloride; or by the use of *di-*, *tri-*, etc., as in English. For the old prefixes *zweifach*, *dreifach*, etc., see the Vocabulary.

Higher and lower oxides are distinguished as *-oxyd* and *-oxydul* (*Eisenoxyd*, ferric oxide; *Eisenoxydul*, ferrous oxide) or by Latin forms (*Ferroxyd*, ferric oxide; *Ferroxydul*, ferrous oxide).

Names of acids in German are formed very simply by attaching the word *Säure* to some other word; as, *Salzsäure* (literally "salt acid"), hydrochloric acid; *Osmiumsäure*, osmic acid. These names are translated into English by attaching the ending *-ic acid* to a suitable combining form; as, *Zinnsäure* (literally "tin acid"), stannic acid, from *stannum*, Latin for tin. Hydracids are designated in German by the ending *-wasserstoffsäure*; as, *Bromwasserstoffsäure*, hydrobromic acid. The German equivalent of *-ous* in naming acids is *-ig*; as, *schweflige Säure*, or, less commonly, *Schwefligsäure*, sulfurous acid. Similarly, *unter-* corresponds to *hypo-* and *über-* to *per-* (*unterchlorige Säure*, hypochlorous acid; *Übermangansäure*, permanganic acid). Any acid name may form an adjective ending in *-sauer*; as, *salpetersaure Lösung*, nitric acid solution; *man-*

gansaures Blei, manganate of lead; *mangansaures Salz*, salt of manganic acid, manganate. Latin names for salts are also used; as, *Manganat*, manganate; and these occur in combination; as, *Bleimanganat*, lead manganate; *Chromisulfat*, chromic sulfate.

Words ending in *-it* in German, as, for instance, the names of a great many minerals, should as a rule be translated with the ending *-ite*; as, *Kainit*, kainite (not kainit). If it seems best to retain the original spelling of a trade name it should be placed in quotation marks or its initial letter should be capitalized; as, *Permutit*, permutite or "permutit" or Permutit.

Organic Nomenclature. There has been much carelessness in translating German organic names, and as a result many uncouth forms are seen in English articles. The following rules represent the usage of the American Chemical Society as embodied in the "Directions to Abstractors," and this harmonizes well with the best usage in Great Britain:

(1) Translate *oxy-* by *hydroxy-* when it designates hydroxyl, as is commonly the case. When *oxy-* designates the ketonic group it is preferably translated *oxo-*.

(2) Translate names of compounds the chief function of which is alcoholic (or phenolic) so that the name ends in *-ol*; as, glycerol, resorcinol, mannitol, pinacol (not pinacone).

(3) When the German ending *-ol* does not indicate hydroxyl it should be translated *-ole* (as, anisole, indole), or in the case of a few hydrocarbons *-ene* (as, *Benzol*, benzene; *Toluol*, toluene; *Styrol*, styrene).

(4) The ending *-in* should be translated *-ine* in the case of basic substances and *-in* elsewhere; as, aniline, glycine, palmitin, albumin. (But for names of alcohols see (2)).

(5) The form *amido-* should be so translated only when it is in combination with an acid group. Usually it is to be translated *amino-*; as, *Amidopropionsäure*, aminopropionic acid; *Amidophenol*, aminophenol. The same holds for imido-, anilido-, etc.

(6) In such combining forms as bromo-, cyano-, chloro-, nitro-, the connective *o* is to be used invariably (with the exception of a few well-established words such as acetamide, cyanamide); as, *Chlorbenzol*, chlorobenzene; *Chloressigsäure*, chloroacetic acid. This usage is by no means universal, but those who can not reconcile themselves to such spellings as "bromoacetic" should at least avoid the German forms bromphenol, acetphenetidine, etc., and use the connecting *o* before consonants.

(7) The German ending *-an* should be translated *-ane* if it is the name of a hydrocarbon (or parent heterocyclic compound) which is *fully saturated*; otherwise, *-an*. Examples: methane, menthane, tolan, furan, pentosan.

(8) Most German simple names of organic acids are correctly translated by

substituting *-ic acid* for *-säure*. Some of the exceptions are old-established names such as *Milchsäure* (lactic acid) and *Valeriansäure* (valeric acid). Elements coming before *-säure* that are likely to be dropped in translating are: vowels (*Syringasäure*, syringic acid; *Benzoessäure*, benzoic acid), *us* (*Cheiranthussäure*, cheiranthic acid), *um* or *ium* (*Cnidiumsäure*, cnidic acid). An *o* should be inserted in translating German Geneva names of acids (hydrocarbon name plus *-säure*). as, *Pentensäure*, pentenoic acid (not pentic acid).

When the name ends in *-insäure* the translator may substitute *-ic acid* for this unless another acid already bears the resulting name; thus *Akridinsäure* is often called acridic acid instead of the longer acridinic acid, but *Mekoninsäure* should be translated meconinic acid because *Mekonsäure* has preëmpted the translation meconic acid. Such exceptions are given in the dictionary as far as possible, but in doubtful cases the longer form "*-inic acid*" would be the safer.

Names ending in *-carbonsäure* are translated *-carboxylic acid*, not *-carbonic acid* (but *-carbonyl chloride* is preferred to *-carboxyl chloride*).

The student should be warned against confusing chemical endings and case endings; for example, *-en* may be equivalent to the English *-ene* or only a plural sign: *Terpenen* means not terpenene but terpenes; *Ketone* means not ketone but ketones; *Terpene*, not terpene but terpenes.

How to Handle Difficulties. If the word sought is not in the vocabulary, or if its meaning is not clear, the experienced dictionary user still has many resources. He is often able to "puzzle out" an obscure word, and the student should practise the art, using the context to guide him. A few possibilities are suggested:

1. The word may be a variant spelling. See *Spelling*, above, and look up other possible forms.

2. It may be an inflected form of a word given in the dictionary. See *Noun Endings* and *Irregular Verbs*, above. A thoro knowledge of German grammar is of course the best assistance here.

3. The word may be a verb with a separated prefix, such as *ab*, *an*, or *zu*. Look for this in the part of the sentence that follows, and hunt the meaning under the compound verb, or, if necessary, deduce what meaning you can from the meanings of the prefix and the simple verb. For example, in the sentence *es fängt an zu sieden*, the meaning of *fängt an* is found under *anfangen*. Such compound verbs are very numerous, and if not found in the vocabulary their meanings can often be guessed, for the prefixes are in reality merely adverbs attached to the verb.

4. The word may be formed from some word which is in the vocabulary by the addition of one or more prefixes or suffixes (see the paragraph on these, above). A number of these combining forms are common in chemical writings, as *ent-*, *-frei*, *-los*, *-widrig*, and their meanings should be familiar. So also verbal

nouns are freely formed from verbs by capitalizing the infinitive or by substituting *-ung* for *-en*, as *Schmelzen* or *Schmelzung* from *schmelzen*, and these cannot all be given.

5. The word may be a *compound* of two or more words. The capacity of German to form such compounds is much greater than that of English, and although a large number are found in this dictionary they are only a small part of those in the literature. Many words drop or add letters in combining. The general meaning of many such combining forms is given in the vocabulary. Occasionally the beginner may make a wrong division of a compound word, and he should bear this in mind; for instance, *Gastrolle* is from *Gast* and *Rolle*, not from *Gas* and *Trolle*. See also the rule for dropping one member of a triplet letter (under *Spelling*, above). In deciphering the meaning of compound words the student who is able will frequently find it helpful to think of the Latin or Greek equivalents; thus, *Überführung* means trans-ference; *Königswasser* means aqua regia; *Lichtmesser*, photo-meter.

Persistent practice is the great essential to acquiring a foreign language vocabulary and sensing its word order and idioms. At the outset the chemical student will find it very helpful to read in German elementary chemical textbooks with the subject matter of which he is familiar. This will serve the double purpose of review and German practice.

Preface

The Beilstein Dictionary (German/English) has been compiled by the scientific staff of the Beilstein Institute to facilitate the use of the Basic Series and Supplementary Series I to IV by those Handbook users whose native language is not German. With a total of about 2,100 entries, it contains most German words occurring in the Beilstein Handbook, as well as all common abbreviations, alphabetically listed with their English equivalents.

An appended supplement (page 59 onwards) lists a series of “standard formulations” frequently used in Beilstein, together with their English translations.

It is our hope that this glossary will prove of assistance to the non German-speaking user of Beilstein, in overcoming any language difficulties which may be encountered.

The editorial staff of Beilstein

Notes for the user

The English equivalents of German words appearing in the Beilstein Handbook are chosen such that in each case the most usual translation in the context of the Handbook of Organic Chemistry is listed first, followed by other possibilities which can also occur in this context. The equivalents of a particular German word which are not relevant to this context are not included; e.g. the word "mittelständig" in a chemical text would almost invariably mean "in a middle or central position" and NOT "middle class" which is the everyday meaning of the word.

German words whose spelling is identical to the English or so similar that confusion is unlikely to arise are generally not included; e.g. the German words "Potential" and "Elektrode" are not listed. Synonyms of English words are not given when their meaning is identical to the word listed; e.g. German "nahe" is translated by the word "near"; the synonym "close", which is identical in meaning, is not given.

Where a German word can have several different translations according to the context in which it occurs (within the wider context of the Handbook), or where the English word given is open to misinterpretation, an explanatory note is provided in brackets; e.g. German "abhandeln" is translated as "treat", the words "a topic or subject" are given in brackets to indicate the usage of this word, which cannot, for example, mean treat a patient, or, treat a solid with a liquid etc.

Past participles and other parts of verbs which may not be immediately recognizable from the infinitive form are listed separately at the appropriate place (alphabetically); e.g. "ist" (is) will be found as well as "sein" (to be).

The preposition “to”, indicating the infinitive form, is included before all English verbs. This enables the user to identify the German word immediately as a verb.

Nouns in German, as in many other languages, with the notable exception of English, are associated with a GENDER, masculine (m), feminine (f) or neuter (n), even though the noun may refer to an inanimate object or an abstract idea. The genders of all nouns included in this vocabulary are indicated by the appropriate letter in brackets behind the German word. This is not only useful for the user who has some knowledge of German but also enables immediate identification of a noun. Another feature which facilitates recognition of German nouns is that they are all invariably written with a capital letter (not just proper nouns as in English).

Most “longer” German words (usually nouns) are compound words formed by simply writing two (or occasionally more) shorter words together (to form a new idea associated with both of them), but without a space or hyphen as is usual in English.

e.g. “reaction vessel” would be written “Reaktionsgefäß” in German, i.e. “Reaktion” (reaction) plus “Gefäß” (vessel). The additional “s” or sometimes “n” between two words merely acts as a link without further significance.

In order to make such “double” nouns easier to read for users of this vocabulary who are unfamiliar with them, they are printed with a hyphen between them, e.g. “Reaktionsgefäß” is written “Reaktions-gefäß”, (clearly indicating the association of ideas), although in the text of the Handbook the two words are more commonly to be found in the composite form without the hyphen. German words beginning with a modified vowel (ä, ö, ü) are to be found immediately after those beginning with the corresponding unmodified vowel. e.g. **ab** before **äb** before **ac** before **äc** etc.

The letters double ‘s’ can be written in two ways in German, either as ss or as ß (similar to Greek beta), according to a special set of rules (which are of no interest to the non-linguist). In order to simplify matters for the non German-speaker and avoid confusion, only the ss form is used in this dictionary.
